

KRISHISETU

AI-Powered Contract Farming Discovery & Decision Support Platform

A Project Concept Note (Part 1)

Team: Rishabh • Rehhat • Anurag

1. Executive Summary

KrishiSetu is an AI-powered decision-support platform designed to bridge the information gap between farmers and verified contract farming companies. Instead of functioning as another marketplace, the platform helps farmers discover, compare and understand contract farming opportunities before cultivation begins. It combines verified opportunities, AI-based recommendations, profitability estimation, risk assessment and simplified contract summaries in regional languages so that farmers can make informed decisions.

2. Problem Background

Contract farming offers guaranteed buyers and better price certainty, yet adoption remains limited because opportunities are scattered across company websites, government portals and local networks. Farmers often depend on intermediaries, lack objective comparison tools and struggle to understand legal agreements. Existing digital platforms typically solve only one part of the ecosystem—market access, advisory or enterprise management—rather than empowering farmers to choose the best contract.

Major Pain Points

- No single platform to discover verified contract opportunities.
- Difficulty comparing multiple contracts objectively.
- Complex legal language and hidden obligations.
- Limited awareness of company credibility.
- No profitability or risk estimation before signing.
- Limited access to schemes and regional-language guidance.

3. Proposed Solution

KrishiSetu acts as an independent AI advisor. Farmers enter their crop, land size, location and preferences. The platform recommends suitable verified contracts, estimates profitability, explains risks, summarizes legal clauses using NLP, suggests government schemes and allows side-by-side comparison of opportunities.

Platform Workflow

Farmer Profile
Crop • Land • Location
AI Recommendation Engine
Compare Verified Contracts
Profitability & Risk Analysis
Simple Language Summary
Informed Decision

4. Why This Idea Matters

Existing Situation	KrishiSetu Approach
Information scattered	Unified discovery platform
Farmer depends on agents	AI-assisted independent guidance
Legal jargon	NLP summaries in local language
No comparison	Contract comparison dashboard
Unknown profitability	AI-based profit estimation
Limited transparency	Verified companies & credibility ratings

Next Part: Target Users, Key Features, Competitive Analysis, Research Gap, and System Architecture.
